

# Manipulate List

Now there is a list consisting many integers. You are required to deal with the following operations on the list.

1. Insert : insert an integer at a certain position
2. Delete : delete the i-th element in the current list
3. Reverse : reverse elements from i-th element to j-th element(i,j inclusive).( eg:"1 2 3" -> "3 2 1" )
4. Query : output the wanted element in the list

## Input

The test file consists of a single test case.

The first line contains a number N ( $1 \leq N \leq 1000$ ) indicating the initial number of elements in the list. Then there will be N integers representing the initial elements in the list. Next line will be an integer Q( $1 \leq Q \leq 50$ ) which means the number of operations. After that, there will be Q lines of operations in the following format:

- (1) 1 i val : insert "val" after the i-th element
- (2) 2 i :delete element at i-th position
- (3) 3 i j: reverse interval  $[i,j]$  of the list
- (4) 4 i: output the i-th element in the list

## Output

For each type (4) operation in the input, print the corresponding output in one line.

Sample Input	Sample Output
6	4
1 2 3 4 5 6	5
12	7
1 3 10	5
2 1	
4 4	
3 3 5	
4 3	
2 2	
1 2 7	
3 1 4	
4 2	
2 5	
3 2 5	
4 4
